Press release

Completely updated product range

One year before its 20th company anniversary, the soldering system manufacturer SMT has brought out a completely updated product range. Thanks to an enormous investment of time, capital and know how, the target we set ourselves has been reached, namely to equip all machine types with the technical details that guarantee economic, simple and safe operation. A new Power Nozzle system is one of the highlights of the new developments. This system optimises heat transfer even more, allowing an additional increase in performance and ensuring improved quality. The absorption system has been modified in order to minimise soiling even further and so reduce cleaning costs. Energy and nitrogen consumption, areas where SMT could already boast extremely low values, have also been markedly reduced. Nitrogen consumption has been decreased thanks to an intelligent nitrogen management system. Energy savings have been achieved by the particularly short distances for process gas conveyance and the use of a granulate instead of the standard condensation process. In addition a touch screen control panel has been integrated which makes the handling of the machines easy and reliable.

It makes no difference whether the customer chooses the SMT XXS, the soldering system for small to medium-sized throughput for laboratory or prototype applications, or whether he requires an SMT Quattro Peak XL to cope with his high-performance, high-speed and serial production, all systems are equipped with the technically sophisticated features that guarantee high process reliability, top quality and low consumption costs.
